

# IONS AND ELECTROLYTES

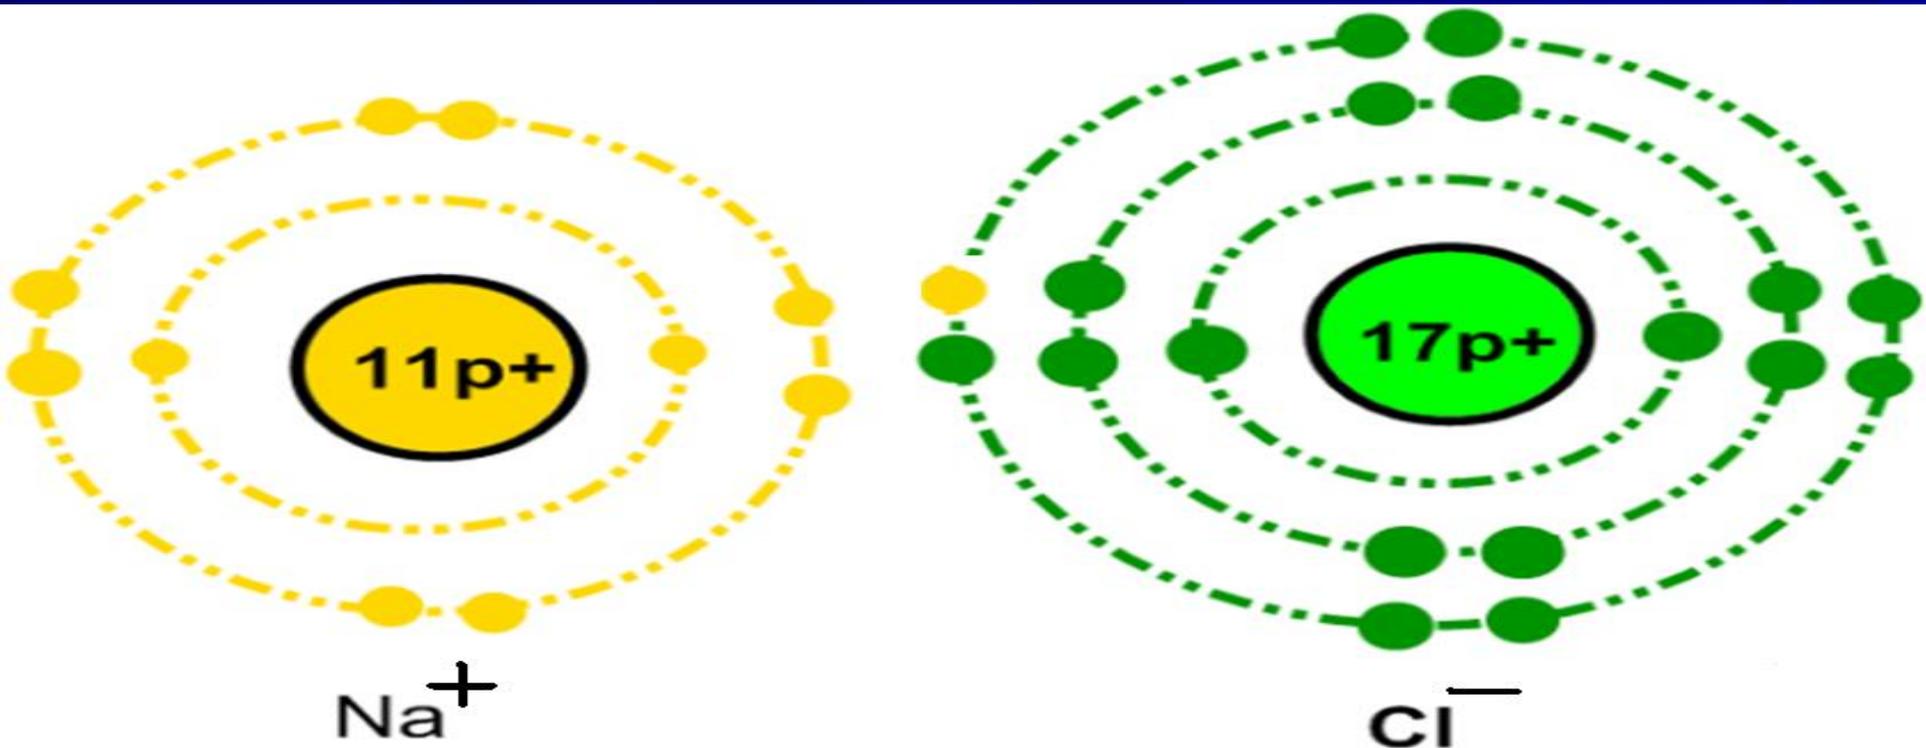

# CHEMICAL STABILITY

- Atoms are chemically stable if they have 8 electrons on the last energy level.
- Exceptions: H, He, Li, Be, B. These atoms are chemically stable if they have 2 electrons on the last shell.

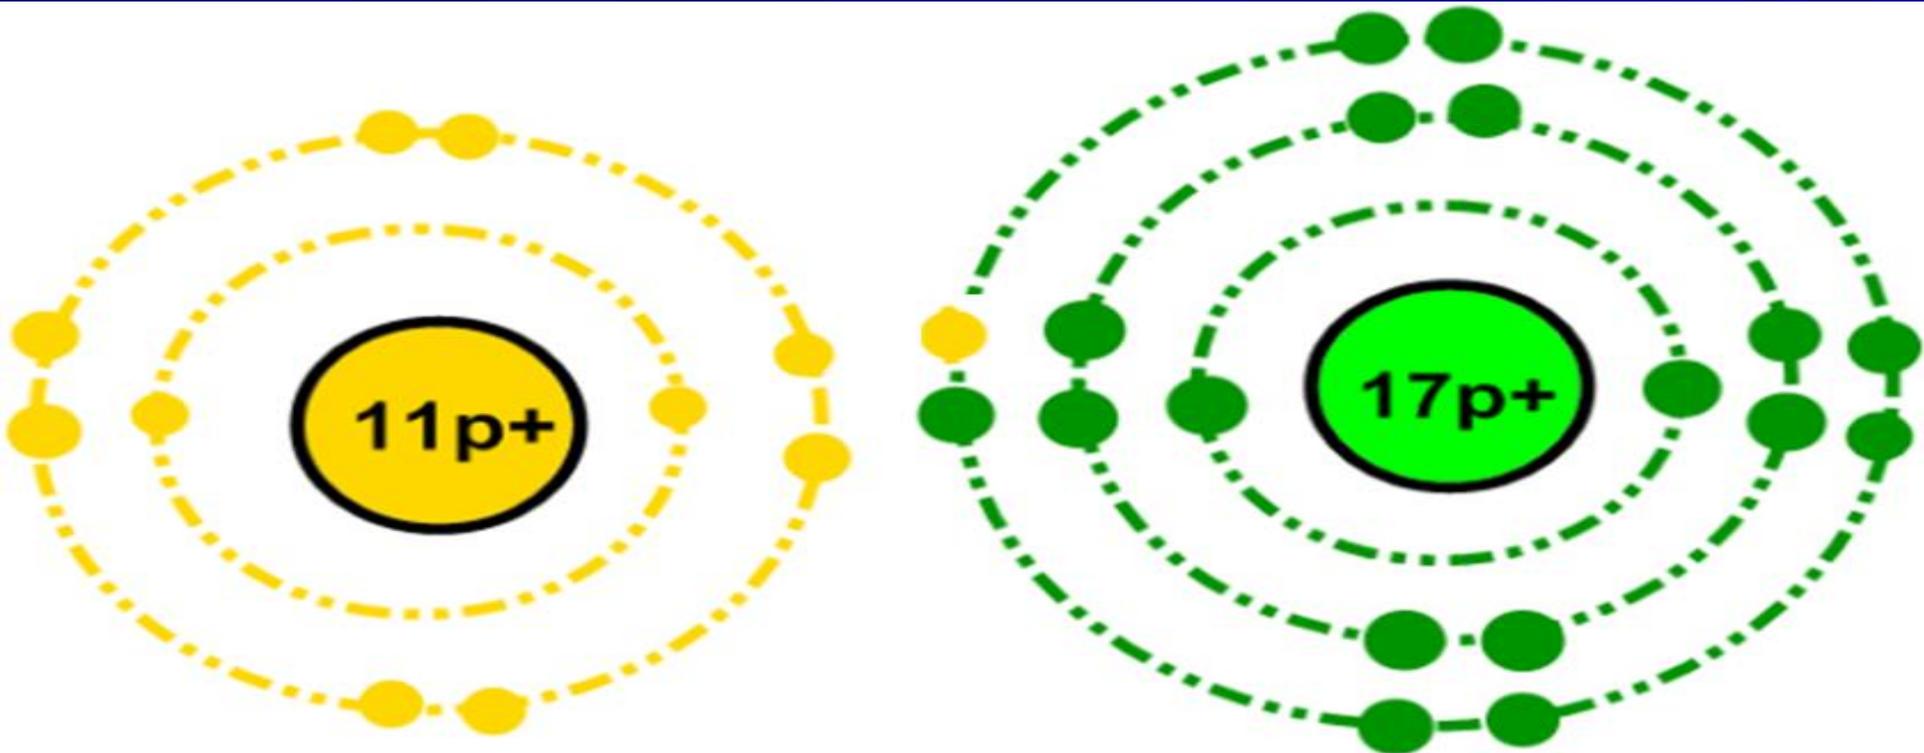

# CHEMICAL STABILITY

- To become chemically stable, in chemical reactions atoms either lose or gain electrons in order to be left with the right amount on the last shell.

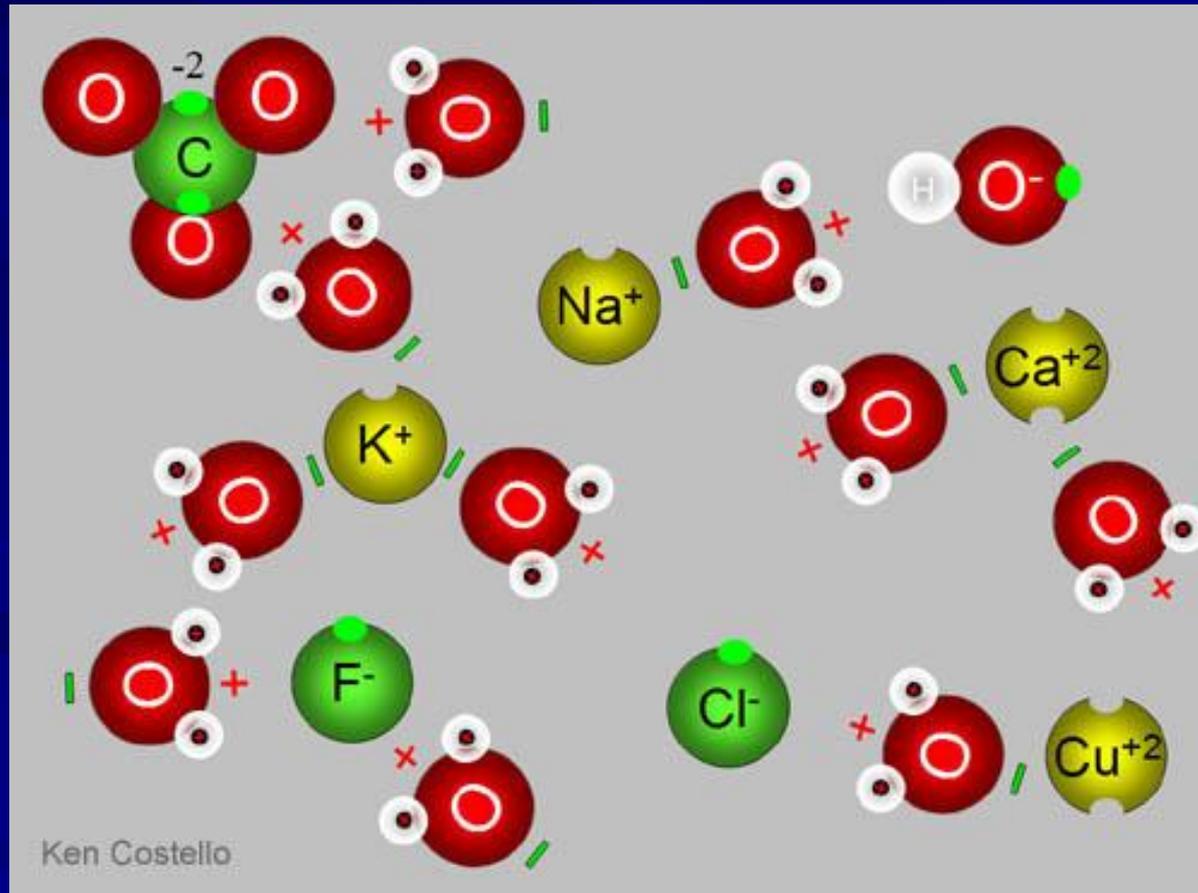

# CHEMICAL STABILITY

- Metals lose electrons and become positively charged.
- Non metals gain electrons and become negatively charged.

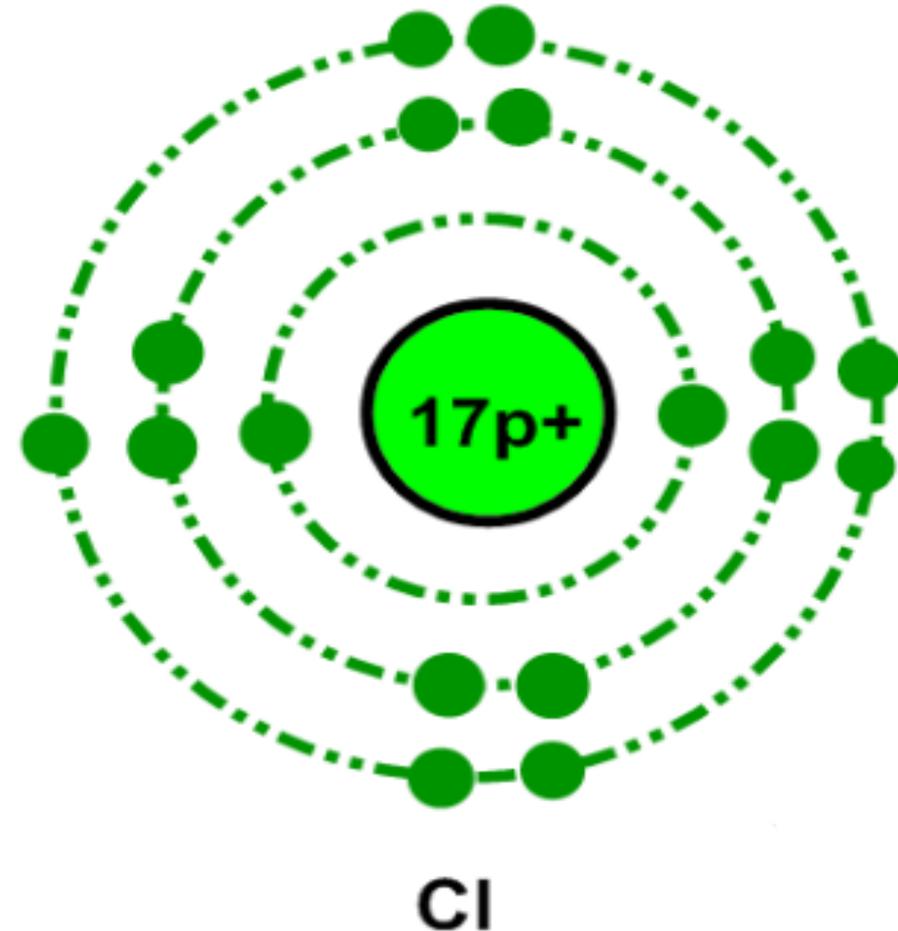

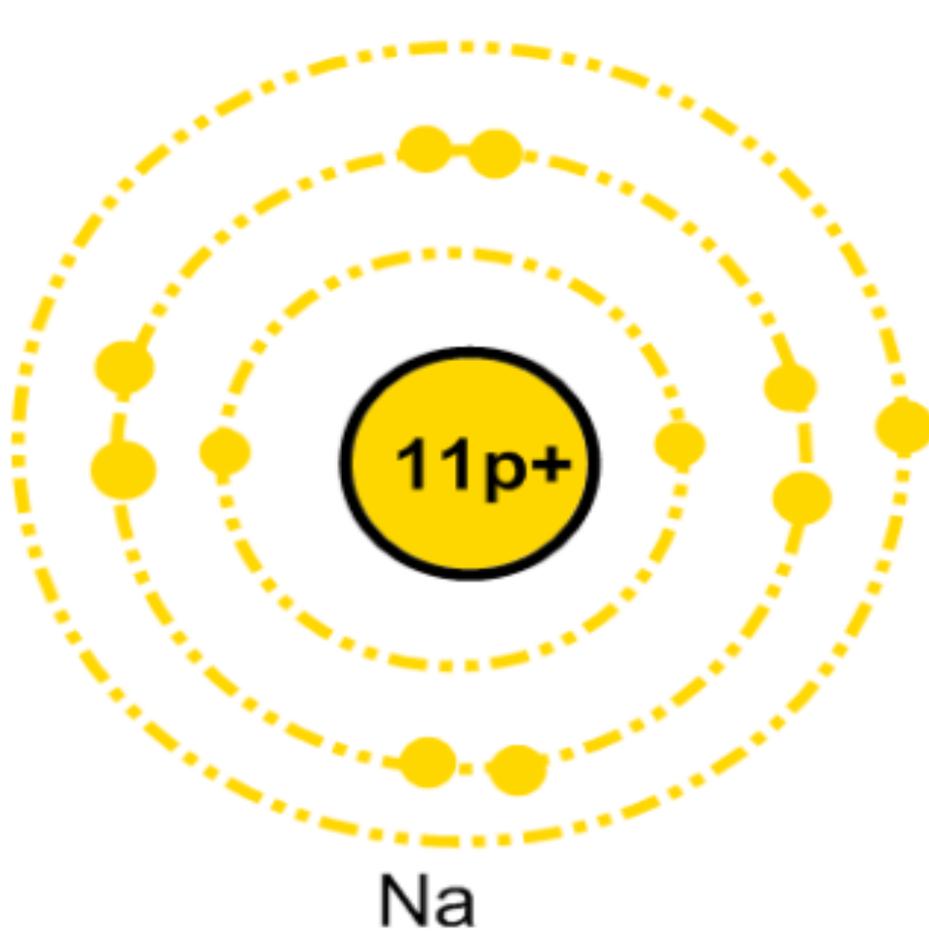

■ **Ions** are particles that **lost** or **gained** one or more electrons. As a result, they carry **positive** or **negative** charges.

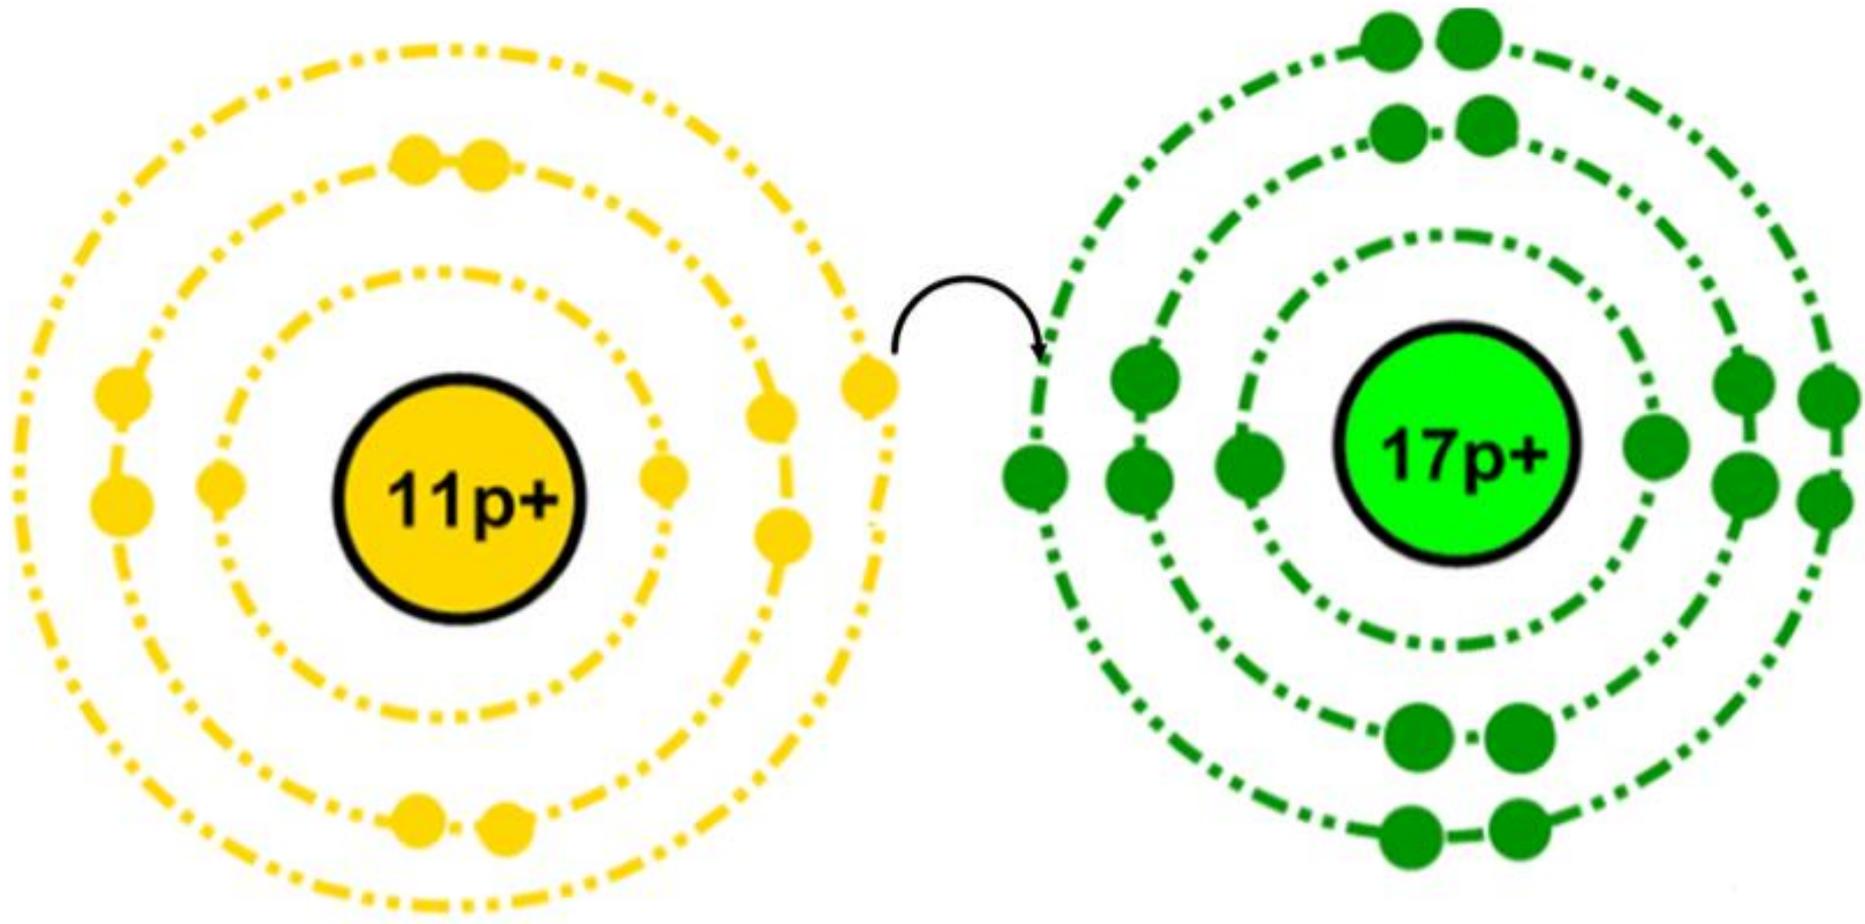

# ■ EXAMPLE: The Sodium chloride molecule (kitchen salt).

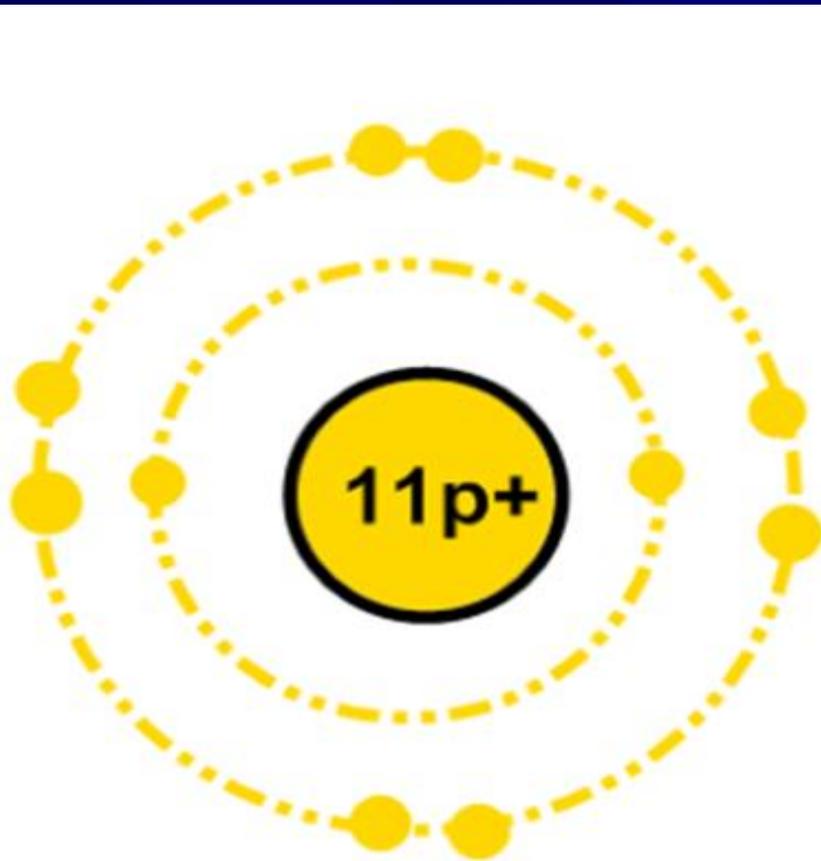

## RUTHERFORD –BOHR DIAGRAMS OF SODIUM AND CHLORINE ATOMS IN NEUTRAL STATE

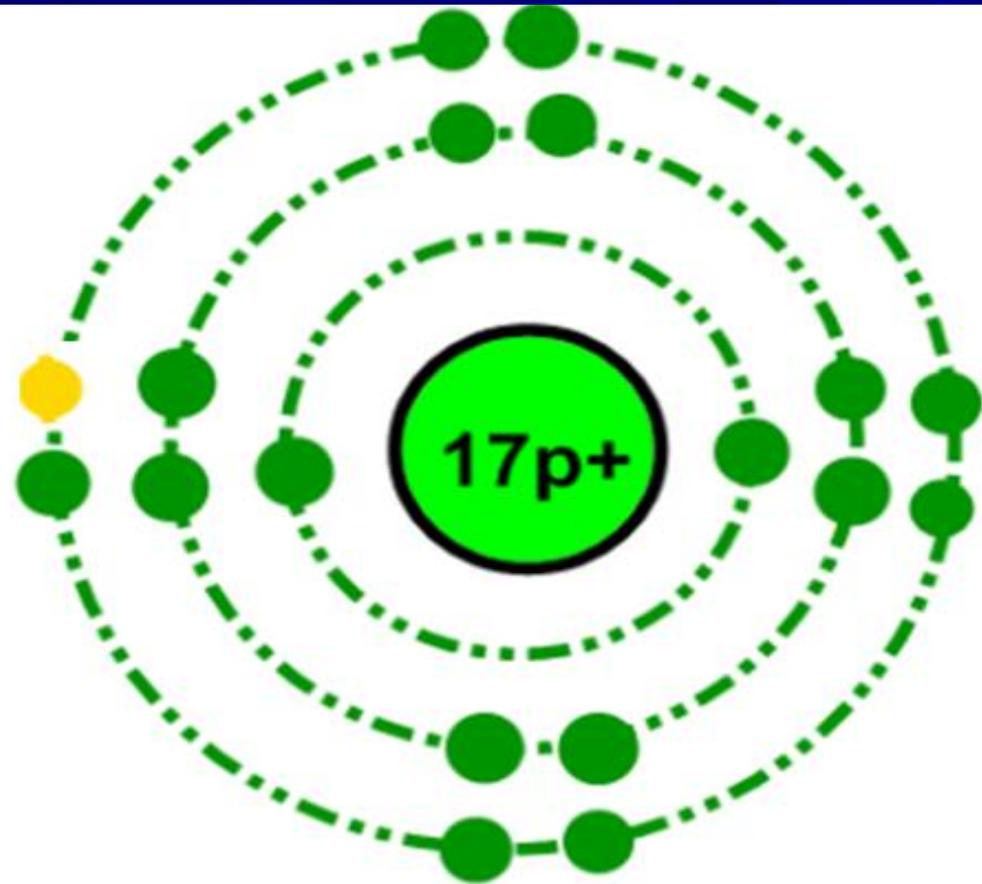

■ In order to become chemically stable, sodium donates one electron to chlorine.

- This way sodium is going to be left with 8 electrons on the last shell and become chemically stable.

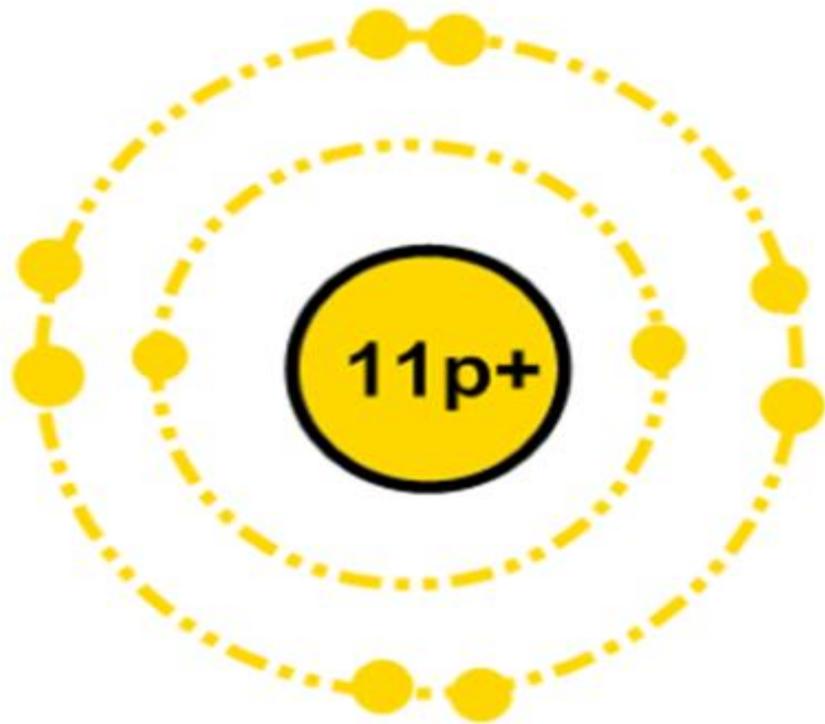

Na

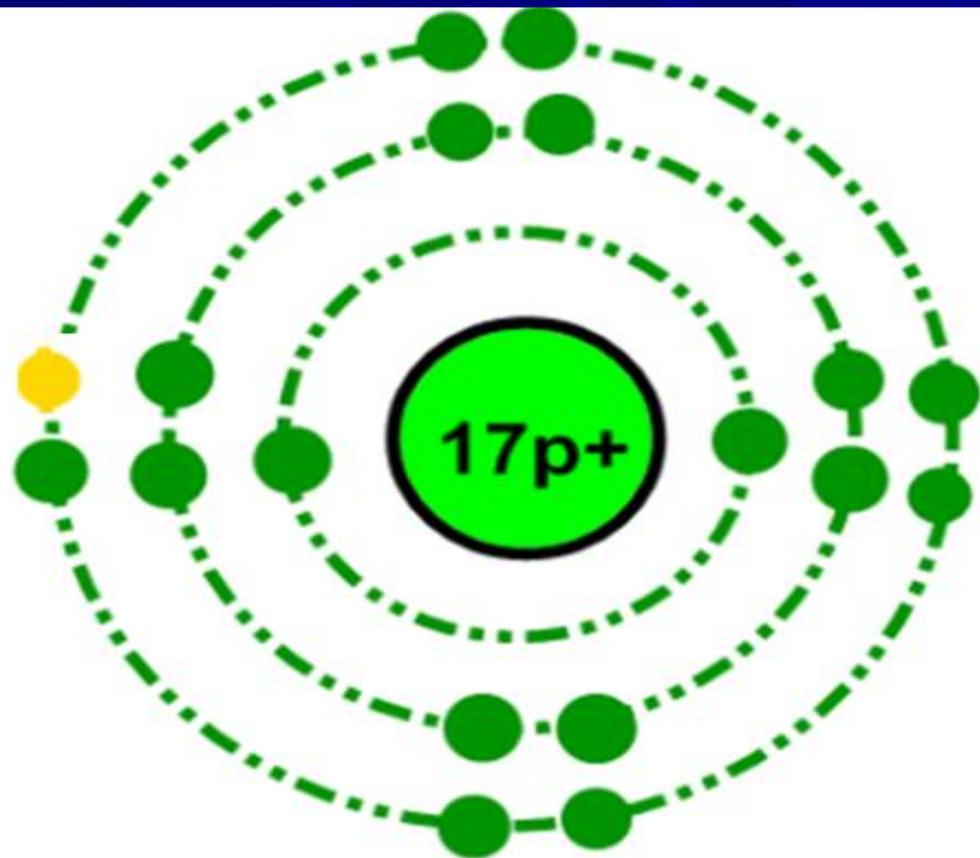

Cl

- Chlorine, by accepting that electron will have also 8 electrons on the last shell and become chemically stable as well.

Na

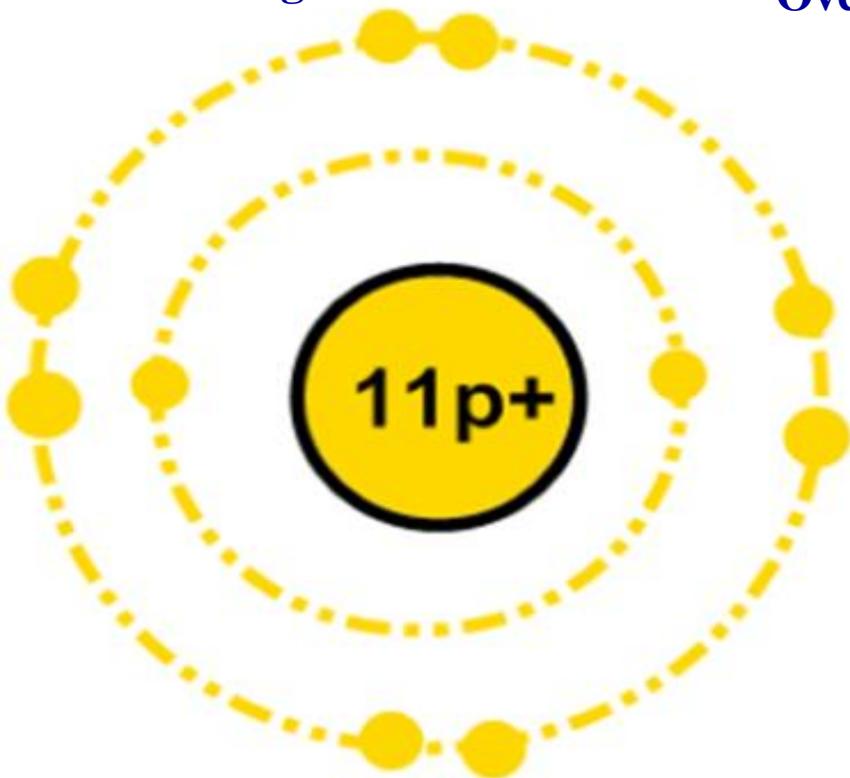

Cl

■ But the electron balance is changed.

Na : 11p+, 10 e-

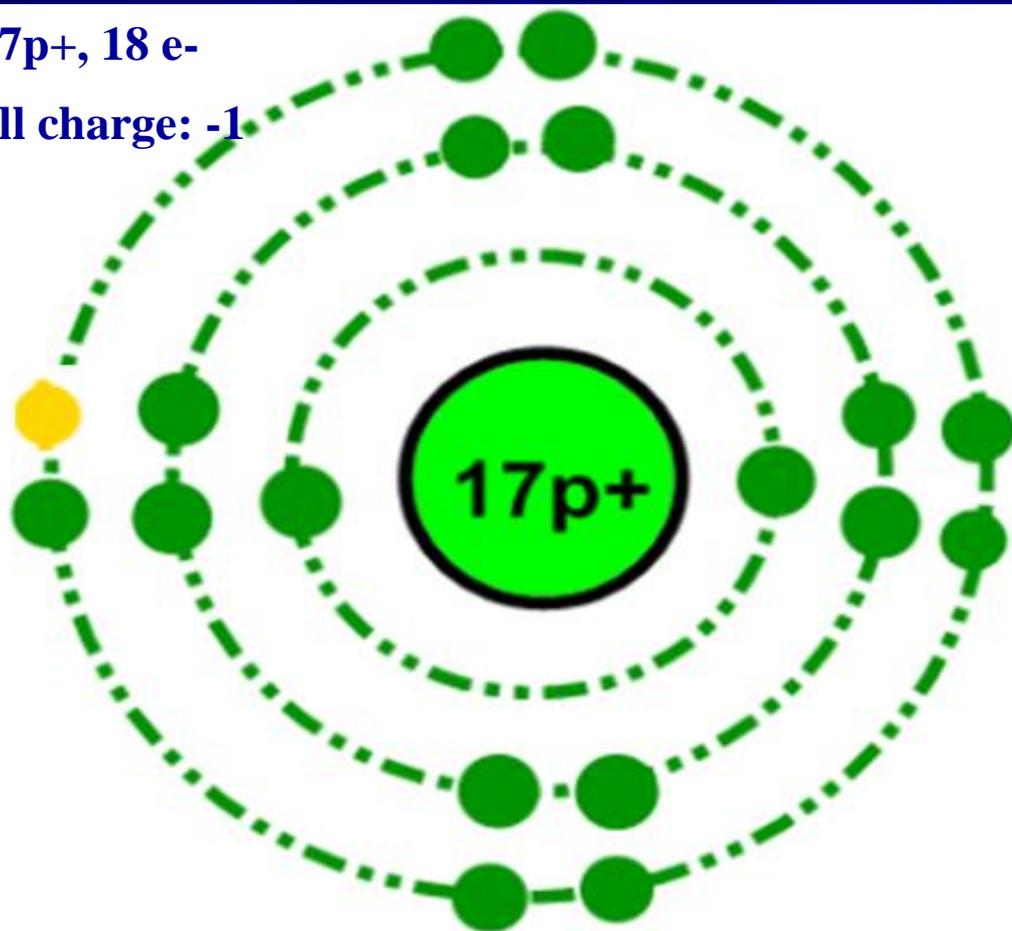

Overall charge: +1

Na<sup>+</sup> Becomes a positive ion

Cl : 17p+, 18 e-

Overall charge: -1

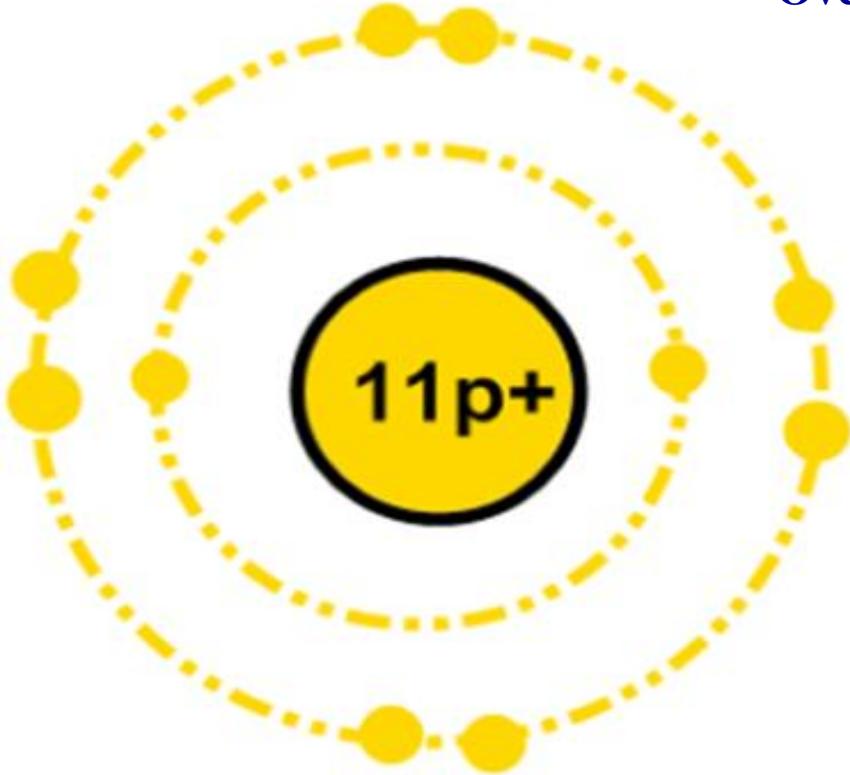

Cl<sup>-</sup> Becomes a negative ion

■ By losing an electron, sodium will have one extra proton and will become a positive ion.

Na : 11p+, 10 e-

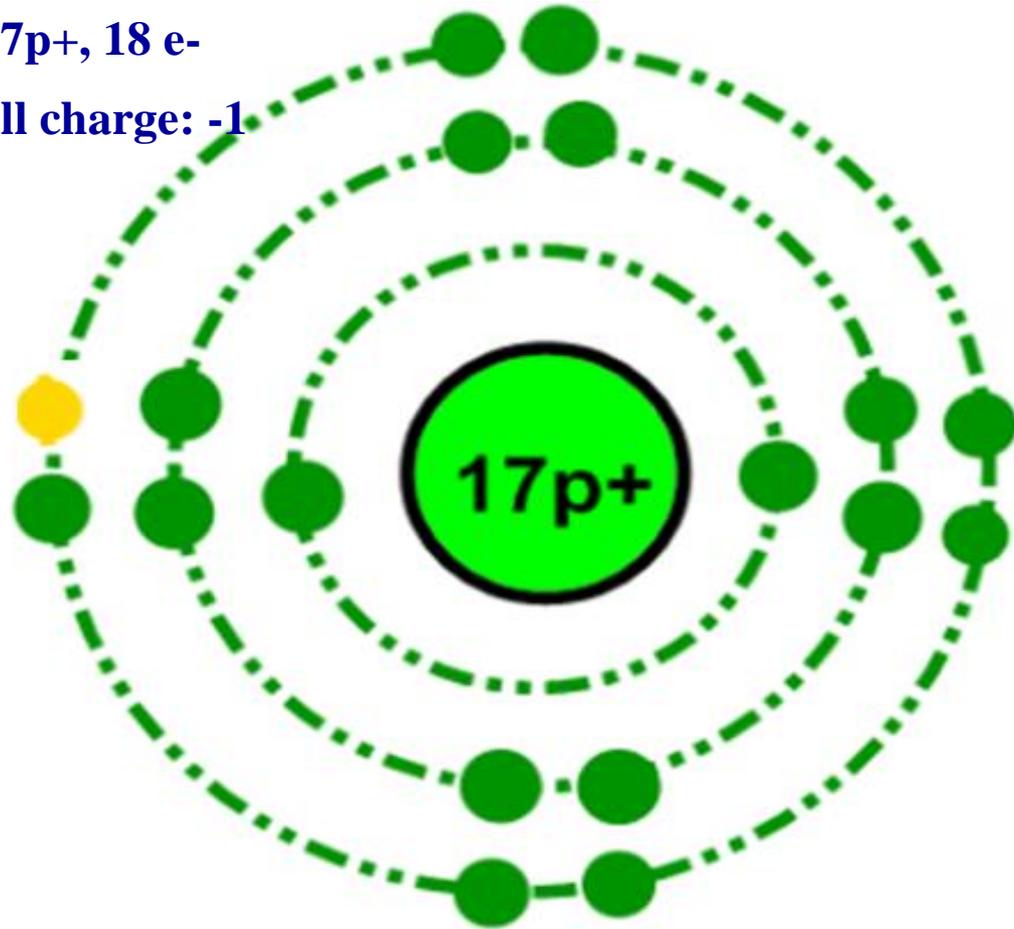

Overall charge: +1

Na<sup>+</sup> Becomes a positive ion

Cl : 17p+, 18 e-

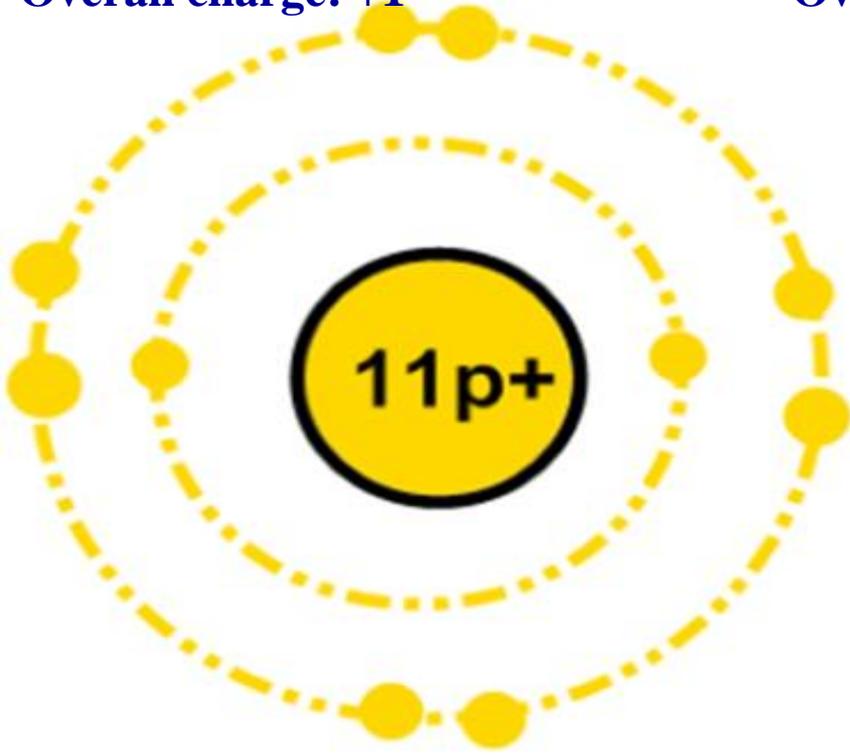

Overall charge: -1

Cl<sup>-</sup> Becomes a negative ion

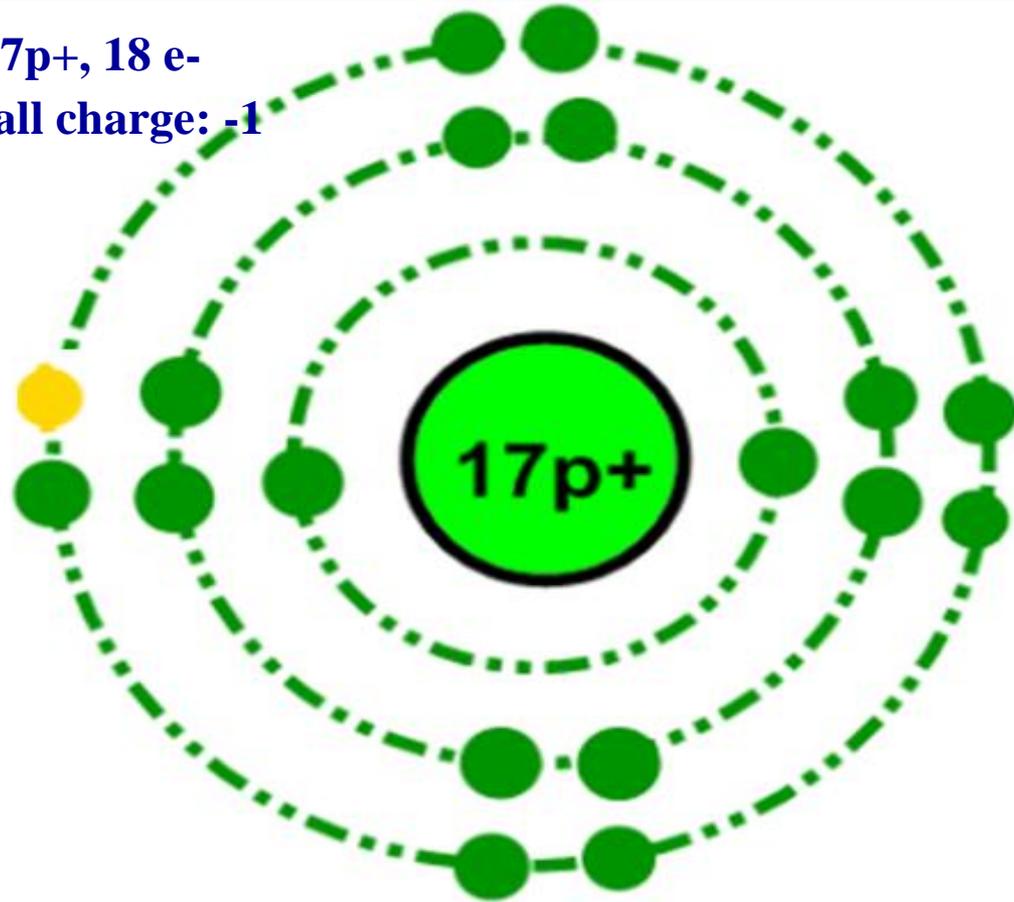

■ Chlorine , by gaining an electron on will have one less proton and will become a negative ion.

Na : 11p+, 10 e-  
Overall charge: +1

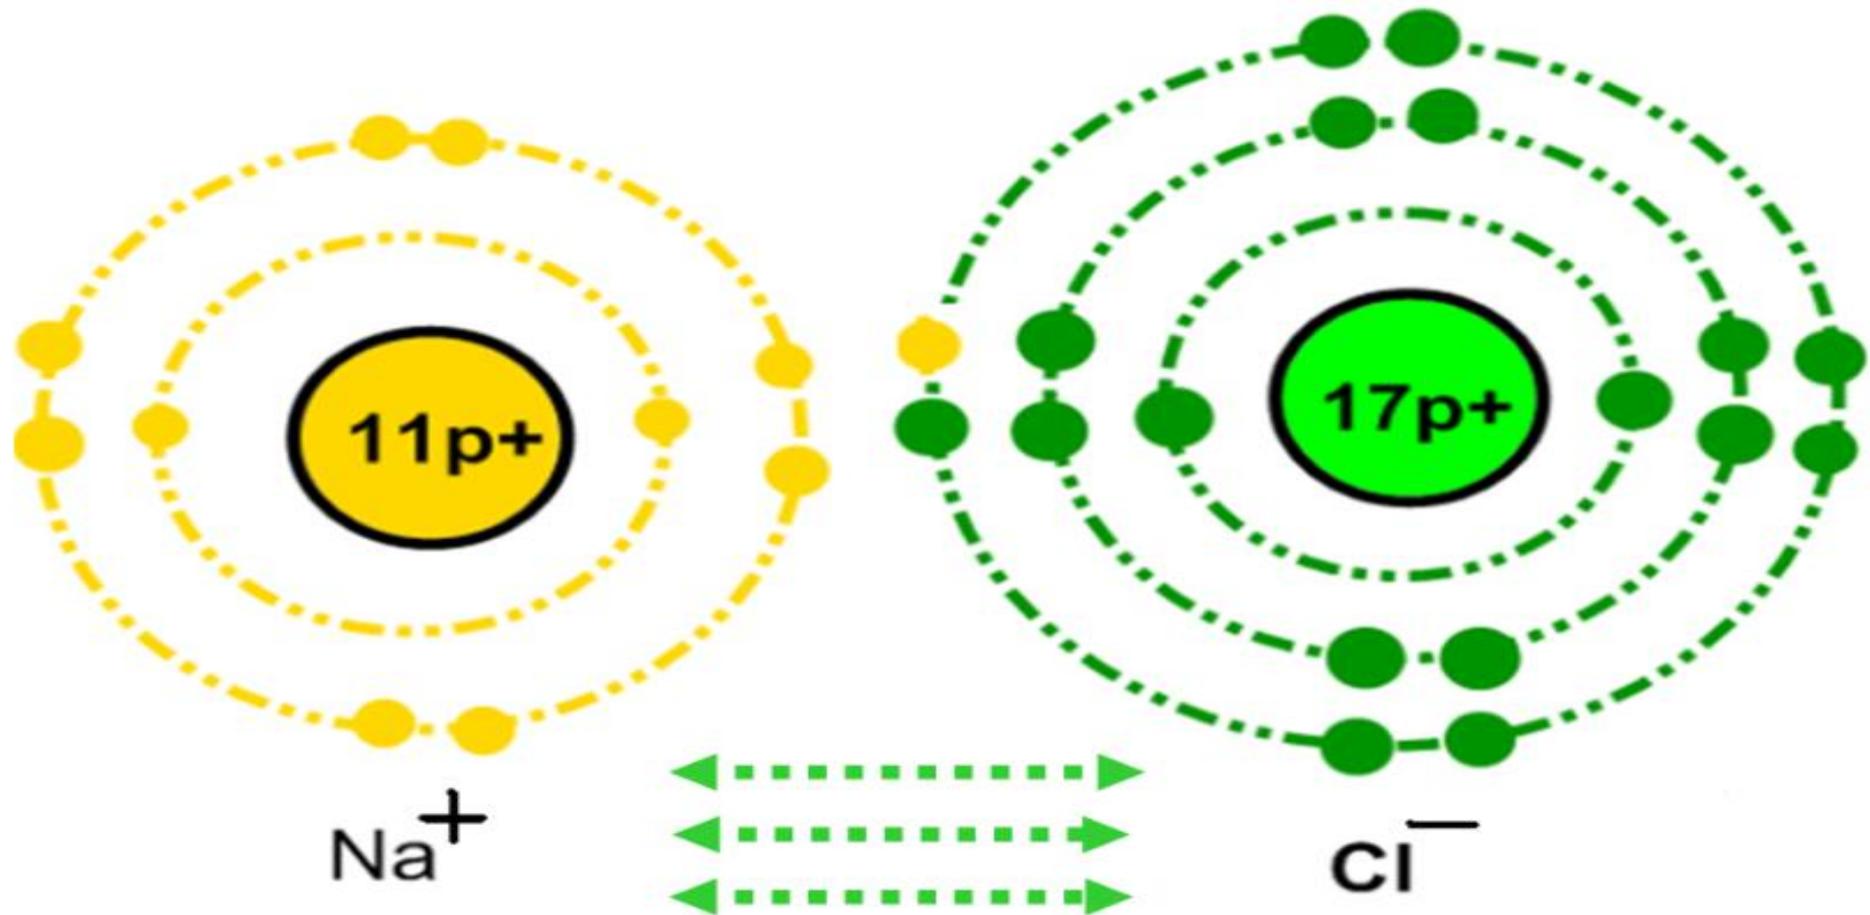

Na<sup>+</sup> Becomes a positive ion

Cl : 17p+, 18 e-  
Overall charge: -1

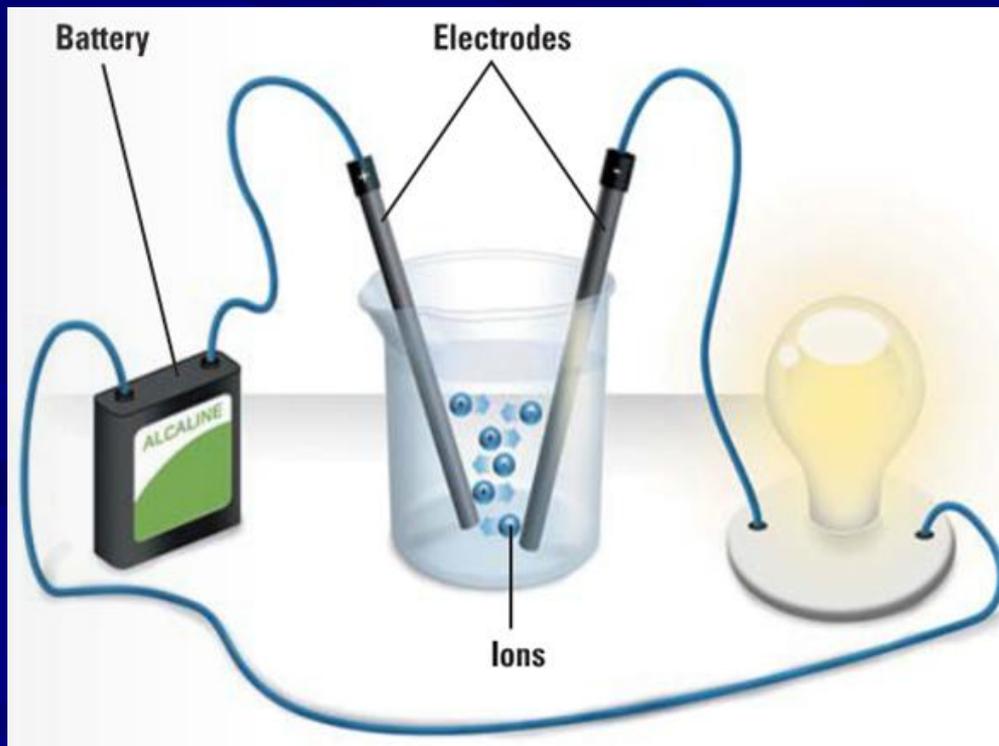

Cl<sup>-</sup> Becomes a negative ion

The NaCl molecule is held together by electrostatic attraction between these two ions with different charges.

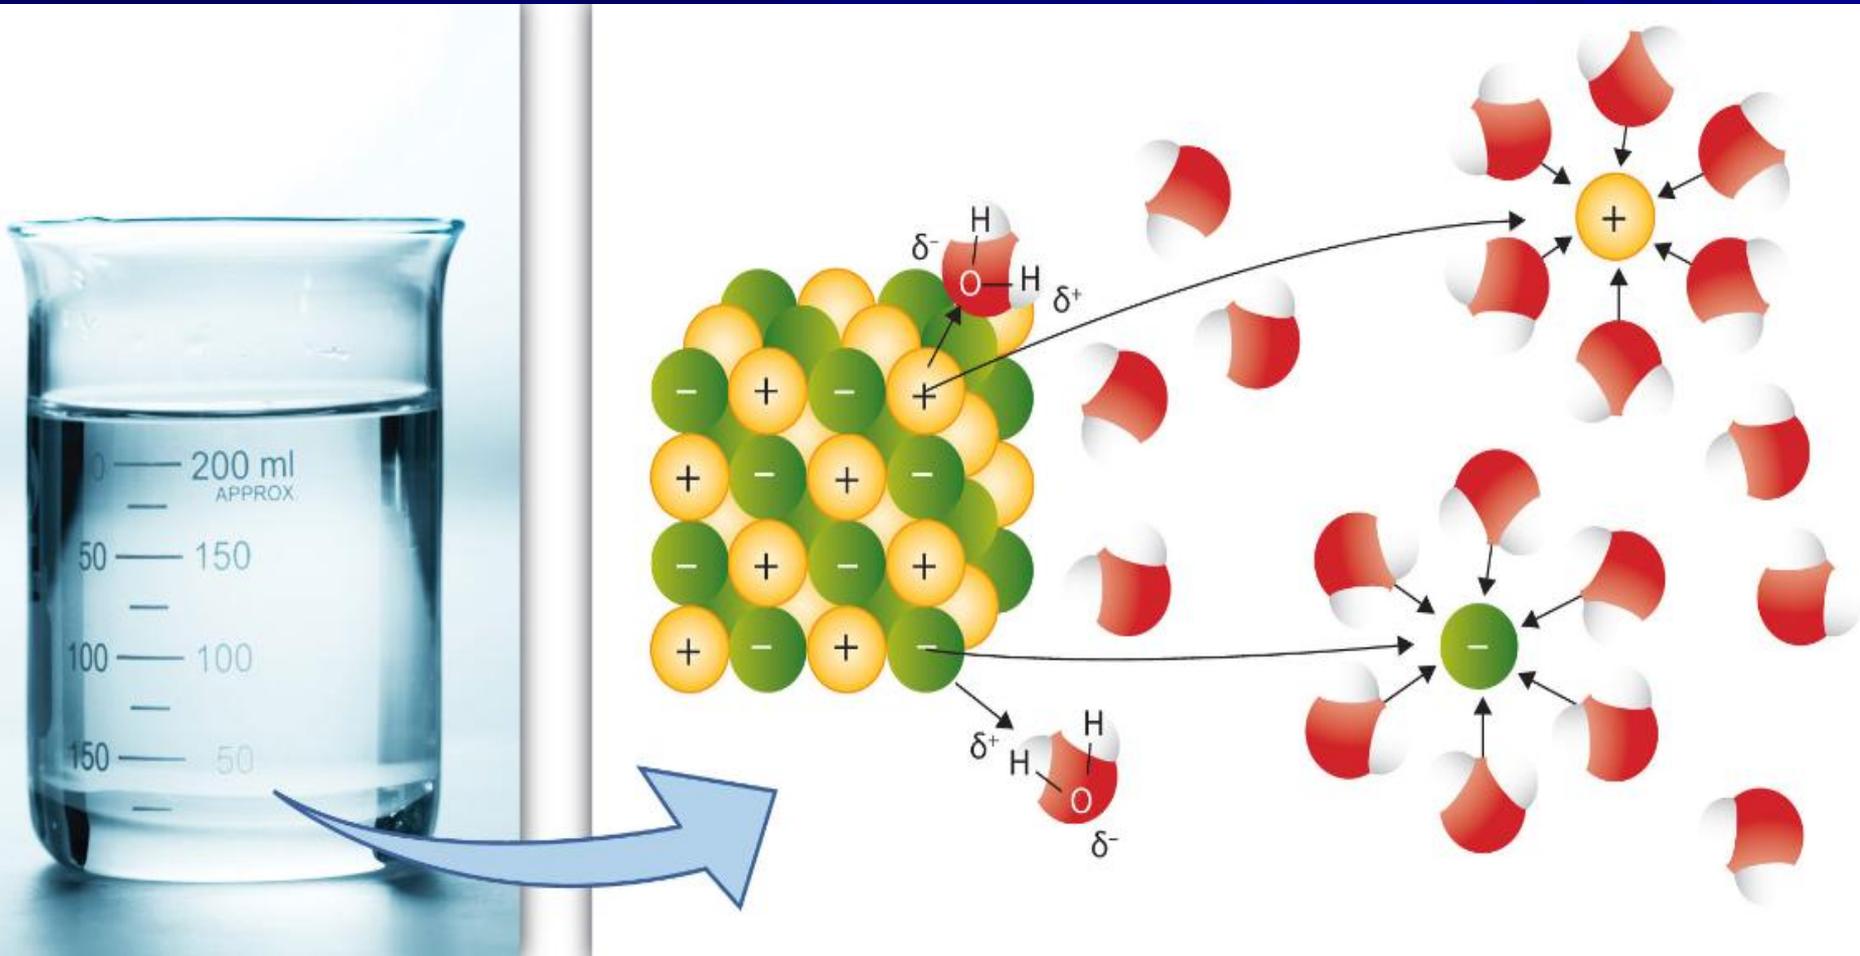

# Electrolytes

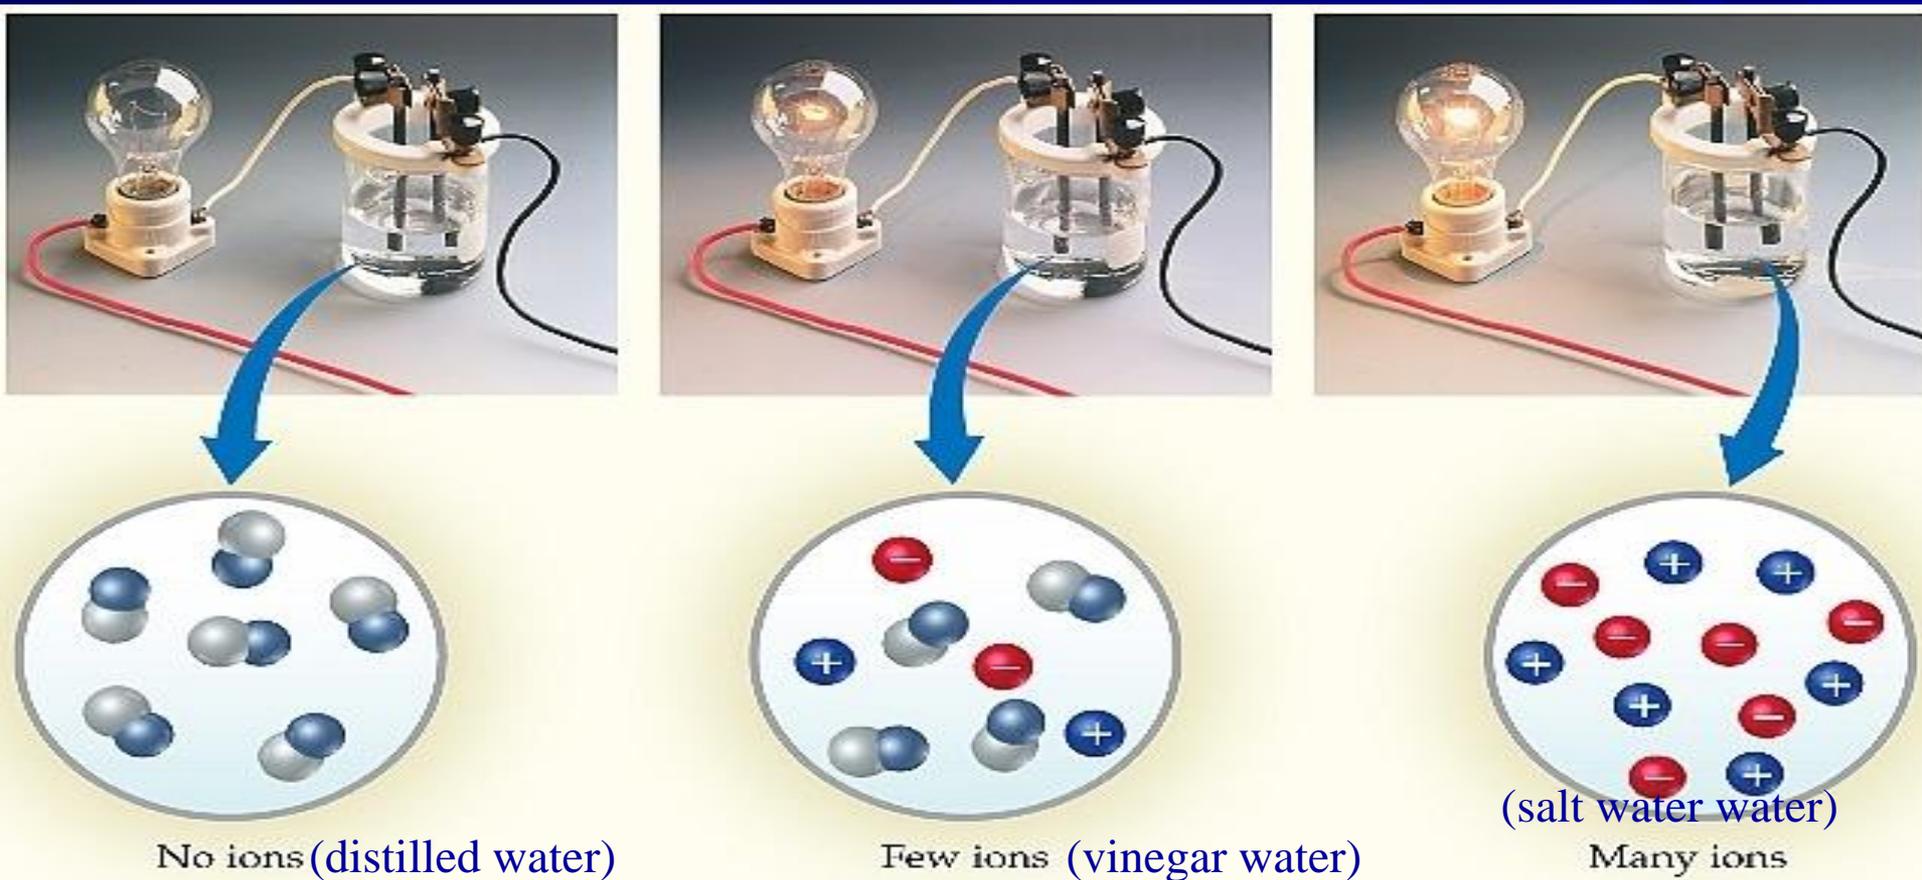

- Electrolytes are substances which enable *electrical conductivity* when dissolved in water, because they release *positive* and *negative* ions.

■ The process by which a substance dissociates into *positive* and *negative* ions (when dissolved in water) is called *electrolytic dissociation* or “electrolysis”.

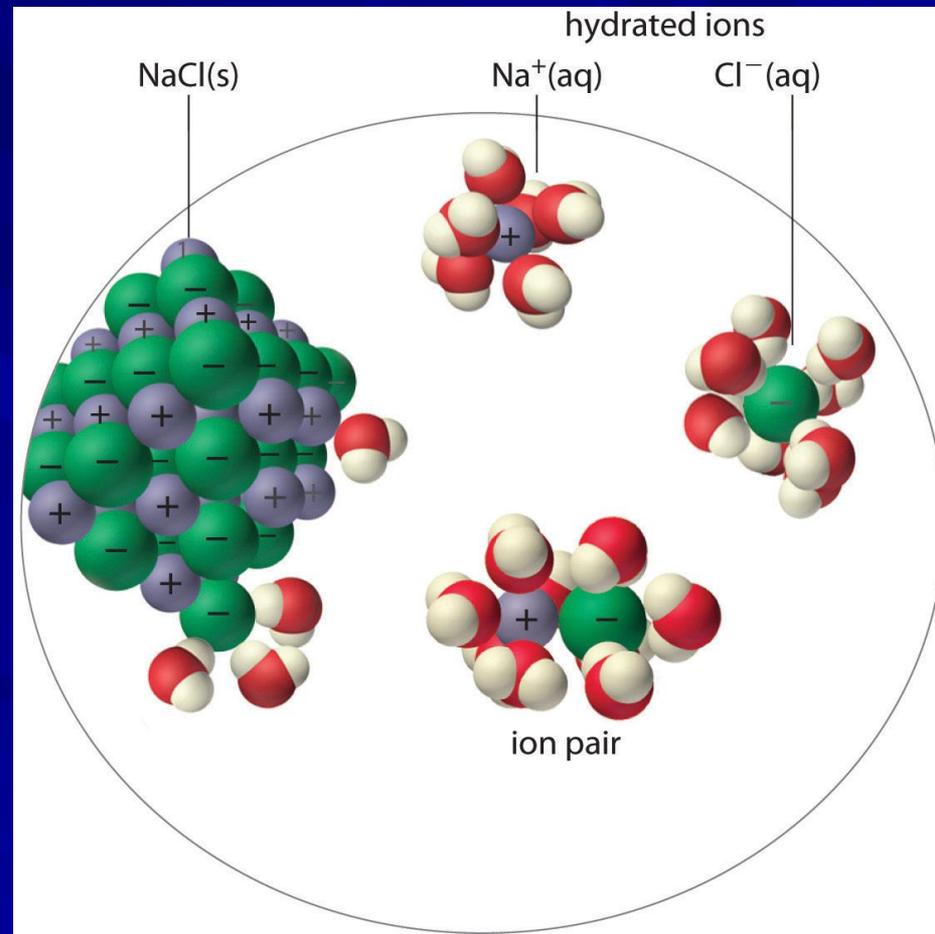

■ The ions liberated by electrolytic dissociation (like  $\text{Na}^+$  and  $\text{Cl}^-$ ) enable a current to pass between the two electrodes inserted into the solution.

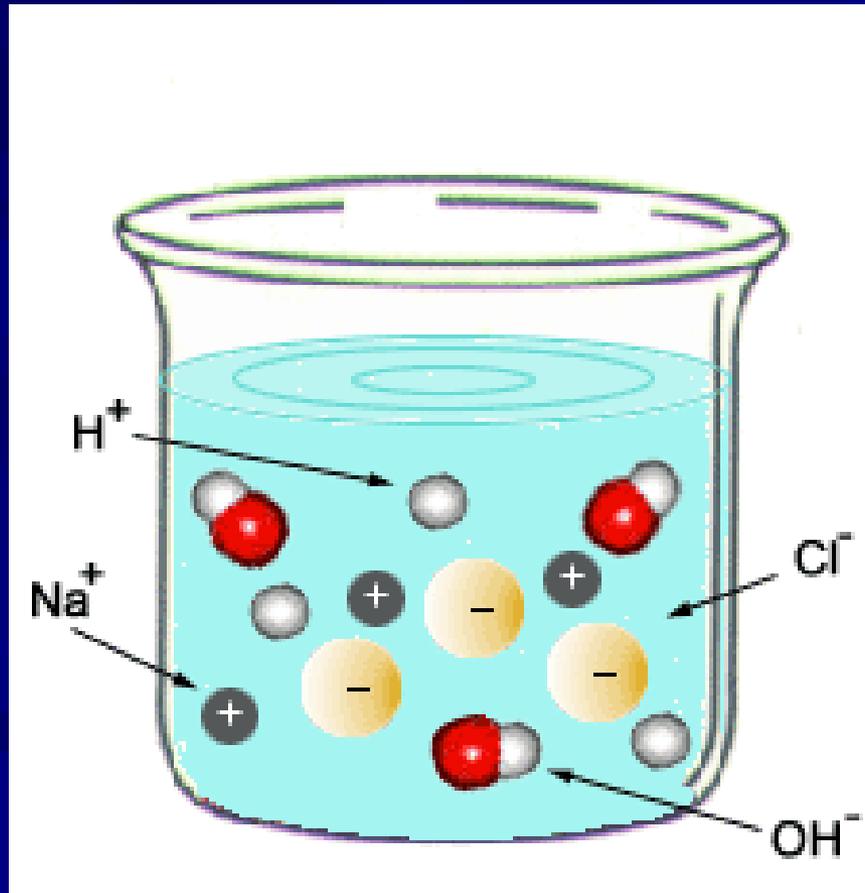

■ When *acids*, *bases* and *salts* are dissolved in water, they become *electrolytes* with particular characteristics.

■ Click on the picture to play the video.

■ Because they have ions in their composition acids, salts and bases are also called “*ionic compounds*”.

# CHARACTERISTICS OF ACIDS

- Acids are chemical substances that *release*  $H^+$  ions in aqueous solutions (when dissolved in water).
- They *neutralize* bases.
- Their  $pH < 7$ .
- Acids *turn blue litmus paper red*.

■ The formula for acids is:

H - Nonmetal

■ Ex: HCl

Metals		Nonmetals					VIIIA
1 IA		13 IIIA	14 IVA	15 VA	16 VIA	17 VIIA	2 He Helium 4.00
1 H Hydrogen 1.01	2 IIA	5 B Boron 10.81	6 C Carbon 12.01	7 N Nitrogen 14.01	8 O Oxygen 16.00	9 F Fluorine 19.00	10 Ne Neon 20.18
2 3 Li Lithium 6.94	4 Be Beryllium 9.01	13 Al Aluminum 26.98	14 Si Silicon 28.09	15 P Phosphorus 30.97	16 S Sulphur 32.07	17 Cl Chlorine 35.45	18 Ar Argon 39.95

# CHARACTERISTICS OF BASES

- Bases are substances that *release  $OH^-$  ions* in aqueous solutions.
- They *neutralize* acids.
- Their  *$pH > 7$* .
- Bases turn *red litmus paper blue*.

■ The formula for bases is:

Ex: NaOH

**Al** Metals      **C** Nonmetals

	1A								VIIIA
1	<b>1</b> <b>H</b> Hydrogen 1.01	2		13	14	15	16	17	<b>2</b> <b>He</b> Helium 4.00
	IIA		III A	IVA	VA	VIA	VIIA		
2	<b>3</b> <b>Li</b> Lithium 6.94	<b>4</b> <b>Be</b> Beryllium 9.01	<b>5</b> <b>B</b> Boron 10.81	<b>6</b> <b>C</b> Carbon 12.01	<b>7</b> <b>N</b> Nitrogen 14.01	<b>8</b> <b>O</b> Oxygen 16.00	<b>9</b> <b>F</b> Fluorine 19.00	<b>10</b> <b>Ne</b> Neon 20.18

			12 IIB						

# CHARACTERISTICS OF SALTS

- Salts are chemical substances that release *metal* and *non-metal* ions other than  $H^+$  and  $OH^-$  in aqueous solutions.
- They are *one of the products* of an acid-base neutralization.
- Their *pH is variable*.
- Their reaction to the litmus paper is also variable, *according to their pH*.

■ The formula for salts is:

Metal - Nonmetal

Ex: NaCl

+

→

sodium metal

chlorine gas

table salt

# THE END

**You are amazing!**

**Thank You**
